This problem gives you the chance to:

- criticise a given measure for the concept of "square-ness"
- invent your own ways of measuring this concept
- examine the advantages and disadvantages of different methods.

## Warm-up

Use visual judgements to answer the warm-up questions.
Which rectangle looks the most square?
Which rectangle looks least square?
Without measuring anything, put the rectangles in order of "square-ness."
Comment:

This first question is simply intended to orientate the students to the task in hand. It may be used as a class discussion.

1. Someone has suggested that a good measure of "square-ness" is to calculate the difference:

## Longest side - shortest side

for each rectangle. Use this definition to put the rectangles in order of "square-ness." Show all your work.

## Solution:

Using the measure 'Longest side - shortest side', the "square-ness" of each rectangle is given in the table below (using centimeters as the unit).

| Rectangle | A | B | C | D | E | F | G | H | I |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Dimensions (cm) | $3 \times 3$ | $1 \times 8$ | $6 \times 2$ | $4 \times 1$ | $3 \times 4$ | $3 \times 2$ | $6 \times 5$ | $4 \times 2$ | $12 \times 4$ |
| Square-ness (cm) | 0 | 7 | 4 | 3 | 1 | 1 | 1 | 2 | 8 |

Using this measure, the rectangles in order from most to least square are:
$A, E$ and $F$ and $G$ (tie), H, D, C, B, I.
2. Using your results, give one good reason why Longest side - shortest side is not a suitable measure for "square-ness."

## Solution:

The above measure is unsatisfactory because:

- It gives no indication of the overall 'proportions'. (E, F and G under this definition have the same square-ness yet are clearly different in shape, while C and I are similar in shape but give different square-ness measures).
- It is dependent on the units used. If we use inches instead of centimetres we get a different "square-ness" measure.

3. Invent a different way of measuring "square-ness." Describe your method carefully below:

## Solution:

There are many other ways of measuring "square-ness." Students might, for example, propose using:
a) The ratio longest side/shortest side;
b) The largest angle between the diagonals of the rectangle;
c) The ratio of perimeter/area.
a) and b) seem equally sensible. c), however, suffers the same problem as before. As it is not dimensionless, an enlargement of a rectangle will result in a different value for its "squareness."

If, however, we use
d) the ratio (perimeter) ${ }^{2} /$ area
then we would have a suitable, dimensionless measure.
4. Place the rectangles in order of "square-ness" using your method. Show all your work.

## Solution:

Whichever measure we now use (a), (b) or (d), we obtain the same order for the rectangles. In order of "square-ness" they are:

A (most square), G, E, F, H, C and I (tie), D, B (least square).

| Rectangle | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{E}$ | $\mathbf{F}$ | $\mathbf{G}$ | $\mathbf{H}$ | $\mathbf{I}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Dimensions (cm) | $3 \times 3$ | $1 \times 8$ | $6 \times 2$ | $4 \times 1$ | $3 \times 4$ | $3 \times 2$ | $6 \times 5$ | $4 \times 2$ | $12 \times 4$ |
| Ratio: Longest $\div$ <br> Shortest | 1 | 8 | 3 | 4 | 1.3 | 1.5 | 1.2 | 2 | 3 |
| Largest angle <br> between <br> diagonals | $90^{\circ}$ | $166^{\circ}$ | $143^{\circ}$ | $152^{\circ}$ | $106^{\circ}$ | $113^{\circ}$ | $100^{\circ}$ | $127^{\circ}$ | $143^{\circ}$ |
| Ratio: Perimeter <br>  <br> $\div$ area | 16 | 40.5 | 21.3 | 25 | 16.3 | 16.7 | 16.1 | 18 | 21.3 |

5. Do you think your measure is a good way of measuring "square-ness?" Explain your reasoning carefully.

## Solution:

Here we would like students to review their results critically and decide whether the results from their measurements accord with their intuitions.
6. Find a different way of measuring "square-ness."

Compare the two methods you invented. Which is best? Why?

## Solution:

This question provides an opportunity for students to look for an alternative measure.
